Armenia has expressed deep appreciation for India's defence technology following its successful deployment during Operation Sindoor. The praise comes after Indian-made military systems reportedly performed with high efficiency during the conflict, reinforcing Armenia's trust in India as a reliable defence partner.

Armenia is one of India's growing defence export clients and was the first international buyer of the Akash surface-to-air missile system. In 2022, Armenia signed a contract worth approximately \$720 million for 15 Akash-1S missile batteries. Deliveries began in late 2024 and continued through mid-2025. According to Armenian defence officials, the system proved highly effective in neutralising aerial threats during the operation.

Indian defence systems deployed in Operation Sindoor reportedly achieved a high kill rate, particularly the Akash missiles, which intercepted hostile drones and missiles with precision. Armenia's forces used a layered air defence strategy with Indian systems playing a key role. Officials from Yerevan described the Akash missiles as reliable and combat-proven.

Apart from the Akash systems, India has also supplied Armenia with other equipment such as the Pinaka multi-barrel rocket launcher, anti-tank guided missiles, SWATHI weapon-locating radars, and various types of smart munitions. Armenia is also seeking Indian assistance in upgrading its legacy Soviet-era military platforms.

Following the operation, Armenian authorities publicly acknowledged the effectiveness of Indian defence equipment. They stated that Indian systems not only performed better than expected but, in some cases, outperformed weapons acquired from other countries. This has prompted Armenia to explore further defence collaboration with India, including in training, maintenance, and future joint development projects.

India's Finance Minister Nirmala Sitharaman noted that the success of indigenous systems like Akash during actual combat situations demonstrates the maturity of India's defence manufacturing sector. She highlighted India's transformation from a heavy importer to a nation capable of producing cutting-edge military solutions.

The Indian government has set an ambitious target of reaching ₹50,000 crore in defence exports by 2029. Armenia's satisfaction with Indian defence hardware is expected to further strengthen this goal and open new markets. Other countries, such as Vietnam and the Philippines, have also shown interest in Indian systems like BrahMos and Akash.

The growing strategic partnership with Armenia reflects a shift in India's global defence posture. With proven results in real-world scenarios, India is increasingly viewed as a credible and dependable defence supplier on the international stage.
