Swiss-based digital asset bank Sygnum has taken another significant step in its collaboration with the Sui Foundation by fully integrating the SUI token into its regulated banking platform. This strategic move aims to strengthen SUI’s presence in institutional markets while providing investors with secure and compliant access to its growing ecosystem.

As the official banking partner of the Sui Foundation, Sygnum will now offer its clients a wide range of services tailored for SUI holders. These include institutional-grade custody, direct trading, and staking. The bank's regulated infrastructure ensures that all operations meet strict compliance requirements, appealing to asset managers, hedge funds, family offices, and high-net-worth individuals seeking exposure to blockchain assets without compromising on security or oversight.

A major highlight of this expansion is the introduction of SUI staking, set to launch in August. Through Sygnum's platform, token holders will be able to generate yield while maintaining the safety of their assets in the bank's custody. This staking service is designed to cater to both experienced crypto investors and traditional finance players who may be entering the blockchain space for the first time. By providing an easy and regulated way to earn passive income, Sygnum is positioning itself as a gateway for the wider adoption of SUI.

Following the staking rollout, Sygnum plans to introduce Lombard loans for SUI holders. This service will allow investors to borrow against their SUI holdings without having to sell them, unlocking liquidity for other investments or operational needs. Such offerings are particularly attractive to long-term holders who believe in SUI's future growth but require access to capital in the short term.

Christian Thompson, CEO of the Sui Foundation, emphasized the importance of this partnership in expanding SUI's institutional reach. He noted that having a fully regulated financial institution like Sygnum on board not only enhances market trust but also opens the door for broader adoption among professional investors. According to Thompson, the collaboration bridges the gap between traditional finance and blockchain technology, creating a robust foundation for SUI's long-term growth.

Sygnum's expansion into the SUI ecosystem aligns with a broader industry trend of increasing institutional participation in digital assets. As regulatory clarity improves in major markets, more banks and financial institutions are beginning to offer crypto-related services. Sygnum, as a pioneer in regulated digital asset banking, has consistently positioned itself ahead of the curve, and this latest integration further solidifies its role as a leader in compliant blockchain solutions.

With secure custody, regulated staking, and innovative financial services such as Lombard loans, Sygnum is providing the necessary tools for institutional investors to confidently

engage with the Sui network. This development not only enhances SUI's market appeal but also contributes to the overall maturity of the digital asset industry. As both blockchain adoption and investor interest continue to grow, partnerships like this could set the standard for how traditional finance and decentralized networks work together to drive innovation and sustainable growth.
